"WHERE TECHNOLOGY MEETS EVERY FARMER'S FIELD."

AgroScan is a student-developed, completely free-of-cost agricultural support system designed to make farming easier, smarter, and more reliable for every farmer. The project was created after observing the real struggles faced in rural areas—farmers often work hard but lack scientific information about their soil, weather conditions, and crop health. AgroScan attempts to bridge this gap by bringing modern technology directly into the hands of farmers in the simplest way possible.

One special feature of AgroScan is its AI assistant, which answers farming questions in simple language. Farmers can ask about seeds, fertilizer use, plant diseases, climate risks, or government schemes, and get guidance immediately. The project also includes learning tools, scientific awareness, and environmental tips to help farmers understand their land better. By combining soil knowledge, climate information, and AI advice, AgroScan supports farmers through their entire growing cycle.

What makes AgroScan truly unique is its ecosystem approach. It includes hardware devices, software tools, climate monitoring, educational content, and a public review system. Real farmers and community members shared feedback while the project was being built, helping improve accuracy and usefulness. Unlike many theoretical projects, AgroScan is practical, continuously evolving, and designed to serve real people in real agricultural conditions—and all without charging users.

At the heart of AgroScan are small IoT devices that collect important data like soil pH, moisture, temperature, and weather changes. This information is sent to the AgroScan platform, where an AI system studies it and offers clear suggestions. Farmers can instantly know if their soil needs fertilizer, if a disease is starting on their plants, or if they should water their crops. The entire process is fast, accurate, and designed so that even first-time users can understand it easily.

AgroScan aims to create a future where farming becomes more scientific and less risky. With better information, farmers can save money, increase their crop yield, protect their soil, and reduce losses caused by weather or disease. By offering all these features for free, the project hopes to support small farmers, encourage sustainable farming practices, and show how student innovations can bring real change to society.

JOURNEY AND PROJECT MOTIVATION - MAKING

Total Members List:
1. **Abhinav Ranjan**
2. **Sudhanshu Kumar**
3. **Abhiraj Singh**
4. **Naitik Jha**

Coordinators:
1. **Mr. Dhananjay**
2. **Mr. Awadhesh**
3. **Mr. Anand**

The members and team coordinators combined to make this super project, not just in thoughts and test but an real working eco-system of tech innovation.

Project Includes:

A. Software [Frontend, Backend, Devend, Repoend]

B. Hardware [Server Handler, AgroNPK Tester, AgroPH, AgroMoisture, AgroLight, Temepature, AgroRain Manager and many more]

The AgroScan team showcased the project at Shemford Futuristic School, Dumri.
They engaged with students and teachers to gather meaningful feedback.
Another exhibition was held at Shemford Futuristic School, Chakkar Branch.
Visitors interacted with the live demo models and tested the full AgroScan system.

Teachers suggested design improvements and clearer user instructions.
Students raised important questions that helped refine the AI assistant's responses.
Hardware and sensor demonstrations were carefully reviewed by the audience.
Every suggestion from both branches was noted and applied into the next update.
The team reworked the interface, improved accuracy, and polished the workflow.
And finally, after continuous improvements, AgroScan became a complete, reliable, and fully student-built innovation ready for real use.

The Final Project Includes the solution of all stacked problems that we solved. Also the major update was launched.
